

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (Currently Amended) A telecommunication system comprising:

a network; and

a terminal communicably linked to said network and generating an indication signal which indicates vocal commanding is to be performed,

wherein said network comprises:

a switch comprising a detector for detecting [[an]] said indication signal generated by said terminal; and

a speech recognizer for vocal commanding, said speech recognizer comprising an adjustor for adjusting a variable capacity parameter for said vocal commanding based on said indication signal detected by said detector.
2. (Previously Presented) A telecommunication system according to claim 1, wherein said adjustor further adjusts said capacity parameter based on a network signal generated by said network.
3. (Previously Presented) A telecommunication system according to claim 1, wherein said terminal comprises a preprocessing unit for preprocessing signals, and said speech recognizer comprising a final processing unit for final processing said preprocessed signals.

4. (Currently Amended) A speech recognizer for use in a telecommunication system comprising a terminal coupled to a network comprising said speech recognizer for vocal commanding and a detector for detecting an indication signal generated by said terminal, said indication signal indicating said vocal commanding is to be performed, said speech recognizer comprising an adjustor adjusting a capacity parameter for said vocal commanding based on said indication signal detected by said detector.

5. (Previously Presented) A speech recognizer according to claim 4, wherein said adjustor further adjusts said capacity parameter based on a network signal generated by said network.

6. (Previously Presented) A speech recognizer according to claim 5, wherein said terminal comprises a preprocessing unit for preprocessing signals, and said speech recognizer further comprises a final processing unit for final processing said preprocessed signals.

7. (Currently Amended) A terminal for use in a telecommunication system comprising a network comprising a speech recognizer for vocal commanding, said terminal being coupled to said network and generating an indication signal which indicates said vocal commanding is to be performed, wherein said telecommunication system comprises a detector for detecting said indication signal and an adjustor adjusting a capacity parameter for said vocal commanding based on said indication signal.

8. (Previously Presented) Terminal according to claim 7, wherein said terminal comprises a man-machine-interface for receiving said indication signal.

9. (Previously Presented) Terminal according to claim 7, wherein said terminal comprises a preprocessing unit for preprocessing signal, with said network comprising a final processing unit for final processing said preprocessed signals.

10. (Currently Amended) Method for use in a telecommunication system comprising a terminal coupled to a network, said network comprising a speech recognizer for vocal commanding, said method comprising:

generating at said terminal [[a]] an indication signal which indicates said vocal commanding is to be performed;

detecting at said network [[an]] said indication signal; and

adjusting at said network a capacity parameter for said vocal commanding based on said indication signal.

11. (Previously Presented) A telecommunications system according to claim 1, wherein said indication signal is generated by said terminal.

12. (Previously Presented) A telecommunication system according to claim 1, wherein said indication signal comprises a telephone number, a key signal or a vocal signal generated by a user of said terminal.

13. (Previously Presented) A telecommunication system according to claim 1, wherein said switch comprises a processor for generating an information signal in response to the indication signal detected by said detector, said adjustor adjusts said capacity parameter based on said information signal.

14. (Previously Presented) A telecommunication system according to claim 13, wherein said processor controls at least one of an available bandwidth, sampling rate, and noise reduction with regards communication with said terminal based on said capacity parameter.
